

COLD★WAR THE IRON★CURTAIN

GFX Assets Instructions

Step 1

Open SEA_Example.psd. In this instruction, we are gonna use this as an example asset. So, please downlaod this.

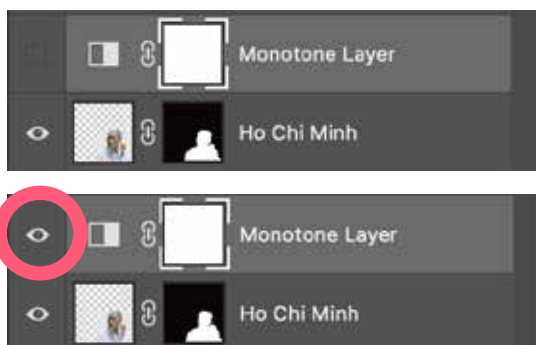

Once you open SEA_Example.psd, you will see the raw png Ho Chi Minh picture and the icon frame.

Also, at the layer tab, you will see all assets there. The basic effects are all there, so no worries about complicated photoshop settings.

What you need to do is clicking and Copy and Paste. Easy work!

Step 2

What we will do here is making Ho Chi Minh looking like a CWIC style.

Usually, a monotone style is preferred, so Monotone Layer is the one you can use to make your assets white and black.

Click the visible button and now you will see Ho Chi Minh colour becomes monotone!

Why is it NOT white and black?
No worries, look at Step 3!

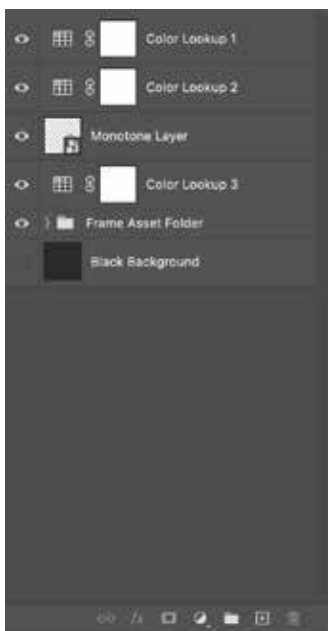

Step 3

Ok now, let just merge Ho Chi Minh and Monotone Layer!

How to merge?

1. Shift+Click both objects.
2. Right click the layers, and click the option 'Convert to Smart Object'

This is how you put effects on your assets basically. Yay!

Once you did merging, put the object over the Color Lookup3 or make it invisible. Basically, that made the Ho Chi Minh not completely white and black. The reason why there is Color Lookup3 is because we

it depending on icon styles. So, just keep it in your mind!

Here are the examples:

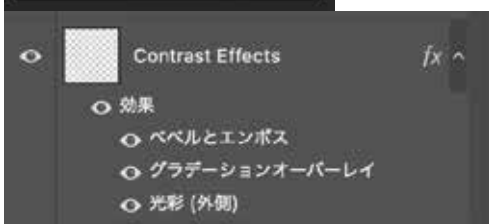

Step 4

Now you can put Ho Chi Minh into the frame! You can erase his shoulder and try making him looking good and fitting into the frame!

***Note:** No need to care about the frame size! Usually, making motifs oversized looks more stylish and alive

Once you have done fitting assets into the frame. Find the Contrast Effects at Layer Tab! Right click and select 'Copying layer styles'

Once you have copied layer styles, right click on Ho Chi Minh Layer, and paste the layer styles!

Step 5

Now, you see the effects made the shape more clear, shadow, and brightness toned down! Simply, the effects make your assets not looking like raw png pictures!

This is the base of traditional CWIC icon styles. We call this 'Comrade Doggo Style'

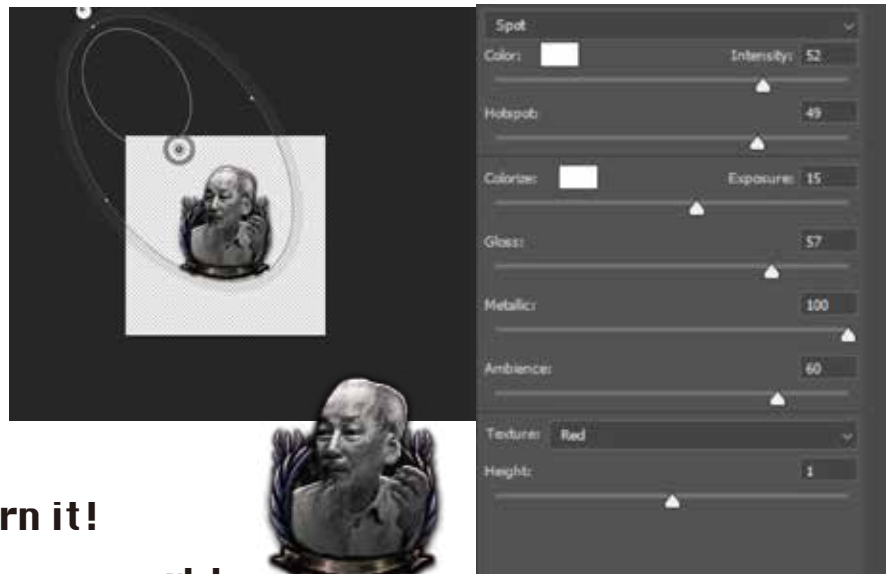

Lighting Effects

Now, go deep dive into Lighting Effects!

We often use Lighting Effects to make assets looking more crispy and wrinkly! We love that style as well, so better learn it! No worries! It is gonna be easy work!

Go Filter/Blending/Lighting Effects
Make it not too dark, not too bright!
That is all! well done!

Here are the example icons with Lighting Effects:

Copy the spotlight settings 🙌

Design Tips

Too make good icons, you need to make based on either pictographic or artistic.

Pictographic icons are easy to understand and less information.

Artistic icons are more visualised and much information.

Here is the pictographic examples:

Here is the artistic examples:

It is just one of design styles, so it depends on your favourite style!
But better choose pictographic designs if you are not confident with your talent and skill.

Proportions

Proportions are very important to design. Even if your assets and skills are good, bad proportions make your icons ugly. Usually, the proportion problem happens when you use over three assets in one icon.

You see the unvisible shapes in those icons. That is the proportion we should care about when we make complicated visual icons!
